
BUSINESS CASE

AI Customer Support for Growing Companies

Stop paying your team to sort. Let AI handle the inbox so they can handle what actually matters.

D2C & ECOMMERCE

SAAS & SOFTWARE

THE PROBLEM

You're not understaffed. You're sorting.

Whether you're a D2C brand or a SaaS company, your inbox has the same problem: 60% of every ticket is repetitive work that shouldn't need a human. Your team reads all of it before they know which 40% does.

DAILY TICKETS

60%

of all incoming tickets are repetitive queries AI resolves automatically — without a human reading them first.

ANNUAL SORTING COST

\$40K

what a support coordinator costs per year when 60–70% of their day is sorting, not responding thoughtfully.

ALERT TIME

2 min

how fast urgent tickets are flagged in live deployment — billing disputes, cancellations, escalations.

ACCURACY

94%+

ticket classification accuracy verified across 3,000+ tickets in production deployment.

Most helpdesk tools (Intercom, Zendesk, Gorgias, Freshdesk) handle where your team responds.
None handle the reading and sorting that happens before. That gap is where GarvinLabs operates.

SECTION 01

D2C & eCommerce

WISMO tickets. Return requests. Billing disputes on Friday afternoon — here's what it costs, and what changes.

Three ways your support inbox is leaking money.

01 — VOLUME

**150–
300**

emails / day

60% are WISMO, returns, and sizing questions your FAQ already answers. Your team reads every single one before they know what to do with it.

That's not support. That's sorting — at \$40,000 a year.

02 — SPEED

\$800

lost per dispute

A billing dispute arrives Friday at 4pm. Team leaves for the weekend. Monday: chargeback filed. That's the dispute amount, plus fees — gone.

With AI triage: your phone alerts within 2 minutes. Every time.

03 — BFCM

3x

volume spike

Ticket volume during BFCM and campaign peaks. Most brands hire a temporary coordinator or leave their team overwhelmed — neither is a real fix.

AI infrastructure cost stays flat at any volume.

What changes when your inbox runs on AI.

BEFORE — MANUAL INBOX		AFTER — AI-POWERED INBOX
✗ Inbox floods every morning. Team reads 200 emails before they can help anyone.	→	✓ Every ticket read, classified, and sorted within 2 minutes of arriving.
✗ Billing disputes and chargebacks found hours or days later — too late to prevent.	→	✓ Disputes flagged to your phone immediately — before the customer can escalate.
✗ Same WISMO reply drafted 30–40 times a day by hand.	→	✓ 60%+ of tickets answered automatically in your brand voice.
✗ No visibility into what's coming in or how it's being resolved.	→	✓ Full dashboard: every ticket logged with category, urgency, and resolution.
✗ Every BFCM requires a temp hire or an overwhelmed team.	→	✓ Volume spikes handled automatically — no new headcount, no overtime.
✗ About to post a job ad for another support coordinator.	→	✓ Current team handles 3× the volume without a new hire.

SECTION 02

SaaS & Software

Password resets. Billing queries. Cancellation requests that sit unread. Here's what a 2-minute response window changes.

The support queue is a churn risk hiding in plain sight.

01 — VOLUME

60%

repetitive tickets

Password resets, "how do I" questions, and billing queries your documentation already answers. Your team reads every one anyway.

That's not support. That's sorting — and it costs the same \$40K a year.

02 — CHURN

6 hrs

unread window

A cancellation request sits unread. No one reaches out. The customer churns — when a two-minute response would have opened a retention conversation.

With AI triage: cancellations are flagged within 2 minutes. Every time.

03 — SPIKES

3x

at release / billing

Ticket volume after a product release or billing cycle date. Bug reports, upgrade queries, and onboarding confusion all land at once on an already-stretched team.

AI infrastructure cost stays flat at any volume.

What changes when your queue runs on AI.

BEFORE — MANUAL QUEUE		AFTER — AI-POWERED QUEUE
✗ Team reads every ticket before knowing if it needs a human or not.	→	✓ Every ticket classified and sorted within 2 minutes of arriving.
✗ Cancellation requests sit in the queue — customer churns before anyone responds.	→	✓ Cancellations flagged immediately — team gets a churn-prevention window every time.
✗ Same billing question or password reset answered 20 times a day by hand.	→	✓ 60%+ of tickets answered automatically — accurately, in your product voice.
✗ Critical bug reports buried under onboarding questions — found hours later.	→	✓ Critical bugs and escalations alert your phone immediately. Nothing waits.
✗ No visibility into ticket volume, categories, or resolution status.	→	✓ Full dashboard: every ticket logged with category, urgency, and action taken.
✗ Every product release or billing date overwhelms the queue.	→	✓ Volume spikes handled automatically — no overtime, no backlog.

Four things the AI handles before your team opens the inbox.

01 — CLASSIFY

Every incoming ticket is read and assigned a category and urgency level within seconds. D2C: billing, shipping, return, product. SaaS: billing, cancellation, bug, onboarding.

Your team opens the inbox already knowing what's there.

02 — PRIORITISE

Critical tickets — chargebacks, cancellation requests, critical bugs — are flagged and alert your phone immediately. Nothing urgent sits in a queue waiting to be found.

Urgent problems reach you in under 2 minutes, not hours later.

03 — AUTO-REPLY

Clear-cut tickets get an accurate, brand-voice response sent automatically. The system only auto-replies when confident — everything ambiguous is flagged for a human, never guessed at.

60% of your inbox handles itself. Your voice, not generic AI text.

04 — FLAG FOR REVIEW

Anything requiring judgment gets a pre-written draft prepared and flagged — context already loaded. Your team reviews and sends in seconds, not minutes of writing from scratch.

Complex tickets arrive pre-answered. Review, not write.

BRAND SAFETY

The system never guesses. Anything ambiguous is flagged for a human with a draft pre-written. You define the confidence threshold before launch. Your brand reputation is never at risk from an unchecked reply.

Three phases. One build. Live in under 2 weeks.

DAYS 1-3 01	Discover One 90-minute call. You walk us through your ticket categories, policies, and edge cases. That's the full ask — everything after is ours to build.
DAYS 4-10 02	Build & Test Full system built and tested against real ticket scenarios — auto-replies, drafted responses, urgent alerts, live dashboard. All calibrated to your brand. You review and sign off.
DAY 11 + 14D 03	Deploy & Hand Off System goes live. Full walkthrough, documentation for non-technical operators, 14 days of post-launch support included. You own it entirely.

OUR GUARANTEE

If classification accuracy drops below 90% in the first 30 days, we rebuild at no cost. No caveats. No extra invoice.

INVESTMENT

Everything included. Starting from \$1,500.

WHAT'S INCLUDED

- ✓ **Every ticket handled automatically.** Read, classified, prioritised before anyone opens the inbox.
- ✓ **Policies built in.** Returns, refund rules, SaaS plan terms — replies reflect your business.
- ✓ **Urgent alert system.** Chargebacks and cancellations reach your phone in under 2 minutes.
- ✓ **Live support dashboard.** Every ticket logged automatically — category, urgency, action taken.
- ✓ **Documentation + recorded walkthrough.** Written for non-technical operators.
- ✓ **14-day post-launch support.** Included — not billed separately.
- ✓ **30-day performance report.** Auto-reply rate, accuracy, hours saved — ready for any board update.

COST COMPARISON

MANUAL SUPPORT — PER YEAR

\$36–60K

Coordinator salary at \$3K–5K/month. 60–70% of their day spent sorting, not resolving.

AI BUILD — ONE-TIME

From \$1,500

You own it. No per-seat, no per-ticket, no monthly fee. Payback for most: under 30 days.

No subscription. No seat fee. Yours permanently.

NEXT STEPS

Book your 30-minute discovery call.

In 30 minutes, we map your inbox: actual ticket volume, the categories eating the most time, and your current toolset. You leave knowing the exact scope for your build and what it costs to keep running support manually. Most founders find the call useful regardless of whether they move forward.

WHO BUILDS THIS

Garvin Chanderia — GarvinLabs

AI systems builder. Designs and builds triage, classification, and automation pipelines for D2C brands and SaaS companies. Every build is done by the same person who designed it — 94%+ classification accuracy and 61% auto-reply rate in production.

AVAILABILITY

5 build slots available this month.

Once filled, next intake opens the following month.
